Latent Class Regression Statistics for Psychosocial Research II: Structural Models December 4 and 6, 2006. Latent Class Regression (LCR) • What is it and when do we use it? • Recall the standard latent class model from last term: – Items measure “diagnoses” rather than underlying scores – Patterns of responses are thought to contain

Friday, July 17, 2020 via Zoom - The goal of this one-day workshop is to help participants gain the theoretical background and applied skills to be able to address interesting research questions using latent class analysis. By the end of the workshop, participants will have learned how to fit a preliminary latent class model to data.

The LC Regression model, also known as the LC Segmentation model: • is used to predict a dependent variable as a function of predictors, • includes an R-category latent variable, each category representing a homogeneous population (class, segment), • different regressions are estimated for each population (for each latent segment), • classifies cases into segments and develops regression models simultaneously.

### A Nontechnical Introduction to Latent Class Models

Latent class analysis is a technique used to classify observations based on patterns of categorical responses. Collins and Lanza’s book, “ Latent Class and Latent Transition Analysis,” provides a readable introduction, while the UCLA ATS center has an online statistical computing seminar on the topic.

### An Introduction to Latent Class and Latent Transition Analysis

With the advancement of computer simulation, techniques such as Latent Class Analysis are becoming more common in research and can offer a different perspective to certain types of analyses. LCA is a useful approach to identify sub-groups within your data, based on (generally) categorical data.

Latent class (LC) modeling is a technique for analyzing case level data with the goal of finding and introducing to the model “latent classes,” or segments that characterize similar groups of cases (e.g. customer segments, medical diagnoses, types of survey respondents, etc.) based on categorical or continuous variables or a combination of these. In this course we introduce LC as a probability model and describe various applications using the demo version of Latent GOLD®.

Description Latent growth curve analysis (LGCA) is a powerful technique that is based on structural equation modeling. Another approach, which will not be directly discussed here, is multilevel modeling, which employs the statistical techniques of general linear regression and specifies fixed and random effects.

The categorical latent class variable (C) is related to the covariates (X) by way of multinomial logistical regression. The Mplus multinomial regression assigns each individual fractionally to all classes using the posterior probabilities, obtained through the EM iterations.

Introduction to Latent Class Analysis This one day course focuses on understanding the principles of Latent Class Analysis via the concepts and parameters estimated. How to decide on the number of latent classes, and interpretation of the model parameters will be discussed. More dates to be announced for the academic year 2018-19.

Aims of Latent Class Analysis •The aim of LCA is to reduce the complexity of data by explaining the associations between the observed variables in terms of membership of a small number of unobserved (latent) classes •Typical applications: learning theory, psychiatric diagnosis, medical diagnosis.

### Introduction to Mplus: Latent variables, traits and classes

The lclass(C3)option specifies that we want to allow for differences in these logistic regression models across the levels of a categorical latent variable named Cwith three classes. Our observed variables are all binary, and we use the logit option to model each one using a constant-only logistic regression.

Latent variable mixture modeling is an emerging person-centered statistical approach that models heterogeneity by classifying individuals into unobserved groupings (latent classes) with similar (more homogenous) patterns. The purpose of this article is to offer a nontechnical introduction to cross-sectional mixture modeling.
